## What To Do after a Previous Non-Immediate Hypersensitivity Reaction (NIHR)

History of **severe** skin eruptions with danger signs

DO NOT give the group of CM to which the severe skin reaction has occured:

- Avoid all ICM after a severe reaction to an ICM
- Avoid all GBCA after a severe reaction to a GBCA

If not done previously, refer the patient *immediately* to a drug allergy specialist

Optimize allergy registration in EPD

\* Consider cross-reactivity of all CM and increased risk of iso-osmolar ICM for NIHR

## Danger signs of non-immediate hypersensitivity reactions:

- Erosive and/or haemorrhagic lesions.
- Blistering and skin disruption.
- Mucosal involvement.
- Extracutaneous organ involvement (high fever, abnormal liver or kidney function, lymphadenopathy)
